

SACRED GOLD PLUS

SACRED GOLD PLUS

How to install 1.2

A patch is not a game. It is the list of differences between the game you already have and the one you want. A patching program reads both and writes a new file: your starting file is never touched.

Half an hour the first time, five minutes after that.

English document · version 1.2
Read this before touching any file.

Contents

First of all: back up	3
Step 1 — Pick the right patch	3
Step 2 — Join the patch to the game	4
Step 3 — Check the result	5
Step 4 — The save	6
What not to do	7
If something is wrong	8

First of all: back up

1. Save from inside the game, from its own menu, not with a savestate.
2. Copy the current game file and its save file (.sav) into a separate folder you will not touch again.
3. Only then begin.

THE ONE RULE

Never work on the only copy you have.

Step 1 — Pick the right patch

The **Patch** folder holds five files. Each starts from a different version and always reaches the same result: *Sacred Gold Plus 1.2 EN*.

How to tell which version you have: not from the file name, which anyone can change, but from the whole-file SHA-256 fingerprint.

If you have	Use
Pokémon HeartGold (USA), original 134,217,728 bytes 65f02a56842b75aa92d775d56d657a56fe3fa993550b 04dc20704ab82d760105	Patch/From-HeartGold-USA.xdelta 5,909,631 bytes c401d5148bdc8f93d877790414e67583defb44f25c17b 33c97cdf2f37f77da9a

Sacred Gold Plus 1.1 English 127,104,144 bytes 281c2d68e442479e679d8b7e36566ade614d236151c6 5c9684bad6985461827d	Patch/From-Plus-1.1-EN.xdelta 309,864 bytes 31c494617154e06a9c03698352f88a4e2620af4acd5ae ee72d6ae6781b8d5198

How to work out the fingerprint

```
on macOS or Linux, in the Terminal:  
shasum -a 256 "your file.nds"  
on Windows, in PowerShell:  
Get-FileHash "your file.nds" -Algorithm SHA256
```

Compare the result with the "if you have" column above. If it matches no row, your version is not one of the recognized ones: see *if something is wrong*, at the end.

A note for players coming from 1.04 with the classic camera (Normal Angle): the patch exists, but the result has the Plus camera. The classic camera comes back with the cheat, as the *what-is-new* guide explains.

Step 2 — Join the patch to the game

Pick one of the three routes. The result is identical; only the program differs. None of the three ships in this download, and none of them is ours: download them only from their official pages.

Route A — Delta Patcher (Windows, macOS, Linux)

Delta Patcher is a windowed program by Marco Calautti. It applies xdelta patches and needs no other program installed.

<https://github.com/marco-calautti/DeltaPatcher/releases>

(on Linux it is also on Flathub)

1. Open Delta Patcher and stay on the "Apply patch" side.
2. In "Original file" choose your starting .nds file.
3. In "XDelta patch" choose the .xdelta file you picked in step 1.
4. Leave checksum validation on if the option is there.
5. Press "Apply patch" and wait. On a file over 120 MB this takes from a few seconds to a couple of minutes.
6. Rename the file that comes out to: **Sacred Gold Plus 1.2 EN.nds**

Route B — UniPatcher (Android)

UniPatcher is an Android program by btimofeev. It applies xdelta3 patches straight on the phone or handheld.

<https://f-droid.org/en/packages/org.emunix.unipatcher/>

<https://github.com/btimofeev/UniPatcher>

1. Extract this ZIP into a folder on the device. Android does not read inside ZIP files: extract first.
2. Open UniPatcher and choose to apply a patch.
3. In "Patch file" choose the **.xdelta** file.
4. In "ROM file" choose your **.nds** file.
5. In "Output file" choose the folder for the result.
6. Tap the confirm button at the bottom right and wait.
7. Rename the file that comes out to: **Sacred Gold Plus 1.2 EN.nds**

Route C — Rom Patcher JS (browser, phone included)

Rom Patcher JS is a web page by Marc Robledo that applies patches inside the browser. Nothing is uploaded anywhere: the files stay on your device.

<https://www.marcrobledo.com/RomPatcher.js/>

1. Open the page in a recent browser.
2. In the first field choose your **.nds** file.
3. In the second field choose the **.xdelta** file.
4. Press "Apply patch" and wait without closing the tab.
5. Save the file you are offered and rename it to: **Sacred Gold Plus 1.2 EN.nds**

WARNING

The game is over 120 MB and the browser has to hold more than one copy of it in memory. On a phone with little memory the tab can close by itself. If that happens, use route A or route B.

If this download also contains a file called **Install-or-update.html**, it is the same idea but ready made: it carries the patches, recognizes your version on its own and checks the result. In that case just open it in a browser, choose the game file and follow the page.

Step 3 — Check the result

The game that must come out is exactly this:

Sacred Gold Plus 1.2 EN.nds

127,104,144 bytes

SHA-256 02426b586e27ac51649c407969bc7cbba871cacec97961d506b6db3a51f23308

melonDS identifier IPKE 19D1EEBB

Work out the fingerprint of the file you got with one of the commands in step 1. If it matches, the operation succeeded to the byte. If it does not, the file is not 1.2: do not play on it, redo the operation starting from the backup.

Step 4 — The save

The save is not inside the game: it is a separate file, usually with the same name and the **.sav** extension.

1. Make a copy of your **.sav** file.
2. Give the copy the same base name as the new game, in the save folder your emulator uses:

Sacred Gold Plus 1.2 EN.nds

Sacred Gold Plus 1.2 EN.sav

3. Open the new game and choose Continue on the title screen. If Continue does not appear, check the name and the folder before starting a new game.

Do not load a savestate made with an earlier version. A savestate is a snapshot of the emulator's memory, not the save the game writes: with a changed game it is not valid.

After updating, check position, party and bag, play a short stretch, save normally, close the game and reopen it. Keep cheats off during this check.

If the save is in the right place, the first Continue brings up this question: the sign that 1.2 has recognized your game. (Frame from the Italian build during testing.)

The game carries on from where you left it.

AN HONEST RESERVATION

A 1.1 save opened in 1.2 and a 1.2 save opened in 1.1 were compared byte for byte and came out identical, and 1.2 keeps its own settings in a block earlier versions ignore.

What has not been tested is a whole playthrough across the change. Keep the earlier game and an untouched save until you are satisfied.

What not to do

- Do not apply two patches one after the other. Pick a single row of the table, the one matching the file you have.
- Do not apply a patch to a game that is already 1.2. It is pointless, and the result would not be playable.
- Do not rename a file to make it look like a recognized version. Recognition reads the content, not the name.
- Do not use **xdelta.exe** or **xdeltaUI.exe** found in old packages. They are third-party executables, not current and not signed: this download leaves them out on purpose. Use the official programs above.
- Do not patch over the only copy you have.
- Do not ask for help by attaching your save or your game file: they must not be shared.

If something is wrong

My game's fingerprint is not in the table

Your version is not one of the recognized ones. It may be a version never released, a file already modified by somebody else, or a damaged file. Start again from a file whose origin you know.

The patching program says the source is wrong

You took the wrong row of the table. Check the starting fingerprint again.

The result's fingerprint does not match

Redo the operation from the backup. If it happens again, try another of the three programs: two different results point at the program or the disk, not at the patch.

Continue does not appear

The save does not have the right name or is not in the right folder. Do not start a new game before checking.

The game freezes after a few seconds on an Android handheld

That is an emulator setting, not a fault in the game: set the system to DS and the per-game console setting to Default.

If a reproducible problem remains, report it here:
